

Executive Summary

The aim of this deliverable is to provide a final assessment for the EPAD Longitudinal Cohort Study (LCS) and the EPAD Trials by February 2020, with the focus on the finishing of its granted period and potential sustainability post-IMI.

The first section of this document includes a description of the final status of the EPAD LCS, in terms of updated number of countries and sites that have participated in the consortium, as well as global number of research participants that have been screened and included in the cohort. In addition, the document revises the data collected throughout the project and the status of its availability for the scientific community. A description of the participants included taking into account their cognitive status and amyloid positivity is also provided. Finally, the approaches proposed and discussed as sustainability strategies for EPAD LCS maintenance in the post-IMI phase are exposed.

The second section of the document focuses on the EPAD Trials final assessment, and consists of a description of the aims and structure of EPAD Trials, including the EPAD proof of concept (PoC) trial and “EPAD other trials”, that could be offered to intervention owners.
